Infrastructure Automation using Terraform - Lab Guide

This Activity demonstrates the creation of S3 Bucket in AWS using Terraform.

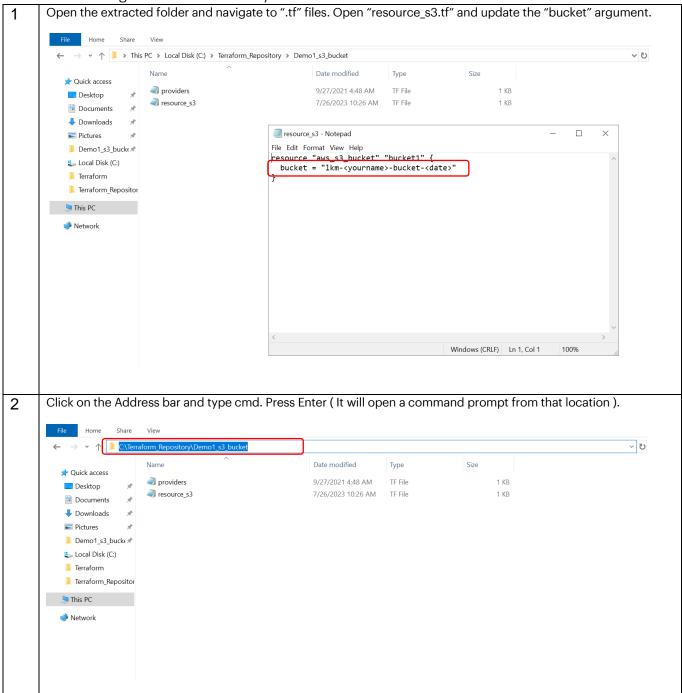

Prerequisite:

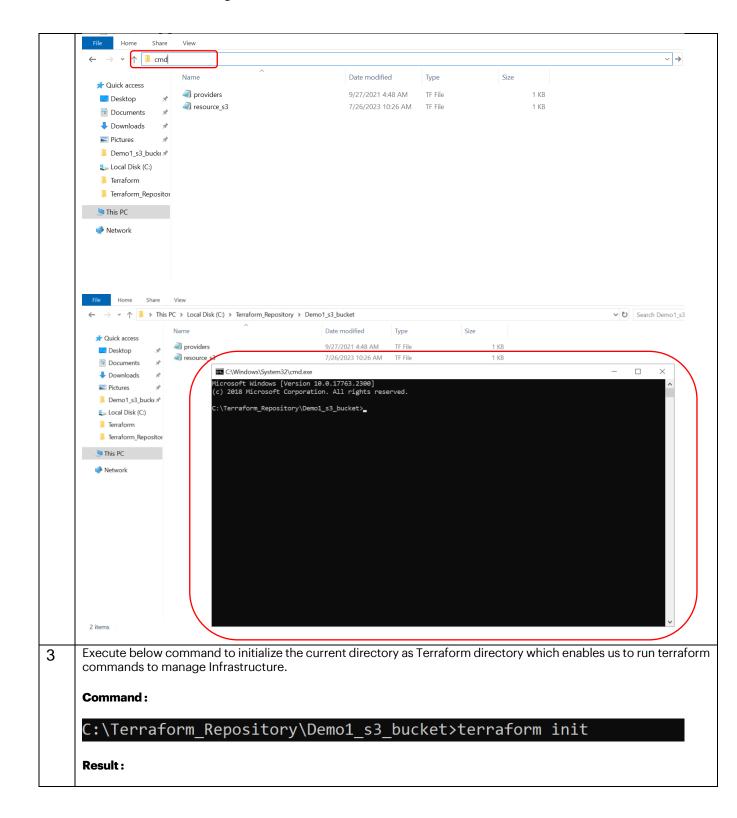

- 1) Make sure Terraform, Git and AWS CLI is installed successfully.
- 2) Update the AWS Credentials (aws configure).
- 3) Download the zip file shared by the trainer and extract it.

Walkthrough:

- 1. Initializing Terraform Directory
- 2. Creating S3 Bucket
- 3. Destroying S3 Bucket

Part 1: Initializing Terraform Directory

C:\Terraform_Repository\Demo1_s3_bucket>terraform init Initializing the backend... Initializing provider plugins... Finding latest version of hashicorp/aws... Installing hashicorp/aws v5.9.0... Installed hashicorp/aws v5.9.0 (signed by HashiCorp) Terraform has created a lock file .terraform.lock.hcl to record the provider selections it made above. Include this file in your version control repository so that Terraform can guarantee to make the same selections by default when you run "terraform init" in the future. ou may now begin working with Terraform. Try running "terraform plan" to see" rerun this command to reinitialize your working directory. If you forget, other commands will detect it and remind you to do so if necessary. C:\Terraform_Repository\Demo1_s3_bucket> Next execute below command to validate syntax and configuration of terraform configuration files. If everything is 4 proper, it will return a success message otherwise it will display the errors. Command: C:\Terraform_Repository\Demo1_s3_bucket>terraform validate Result: C:\Terraform Repository\Demo1 s3 bucket>terraform validate Success! The configuration is valid. C:\Terraform_Repository\Demo1_s3_bucket> Next run below command and observe the output. The output contains information depicting all the changes which 5 what we want.

will happen in the AWS cloud. It is like dry-run to ensure whatever we are trying to do using terraform commands is

Command:

C:\Terraform Repository\Demo1 s3 bucket>terraform plan -out "s3.tfplan"

Result:

```
:\Terraform_Repository\Demo1_s3_bucket>terraform plan -out "s3.tfplan'
Terraform used the selected providers to generate the following execution plan. Resource actions are
indicated with the following symbols:
Terraform will perform the following actions:
 # aws_s3_bucket.bucket1 will be created
   resource "aws_s3_bucket" "bucket1"
      + acceleration_status
                                     = (known after apply)
                                     = (known after apply
                                     = (known after apply)
      + arn
      + bucket
                                        "lkm-neeha-bucket-2607"
                                    = (known after apply)
      + bucket_domain_name
      + bucket_prefix = (known after apply)
+ bucket_regional_domain_name = (known after apply)
      + force_destroy
                                     = false
      + hosted_zone_id
                                     = (known after apply)
                                     = (known after apply)
      + object_lock_enabled
                                    = (known after apply)
      + policy
                                     = (known after apply)
                                     = (known after apply)
      + region
                                     = (known after apply)
      + request_payer
                                        (known after apply)
      + tags_all
       website_domain
                                        (known after apply)
```

Part 2: Creating S3 Bucket

1 For creating a S3 Bucket, execute below command and observe the actions performed by the command.

Command:

```
C:\Terraform_Repository\Demo1_s3_bucket>terraform_apply_"s3.tfplan"
```

Result:

```
C:\Terraform_Repository\Demo1_s3_bucket>terraform apply "s3.tfplan"
aws_s3_bucket.bucket1: Creating...
aws_s3_bucket.bucket1: Creation complete after 4s [id=lkm-neeha-bucket-2607]
Apply complete! Resources: 1 added, 0 changed, 0 destroyed.
C:\Terraform_Repository\Demo1_s3_bucket>_
```

Part 3: Destroying S3 Bucket

1 Execute below command to destroy the S3 Bucket which we have created in previous step. After you execute below command, it will show you what changes will be done and before doing those changes it will ask for your approval. So, if you want to proceed with destroying S3 Bucket, provide "yes".

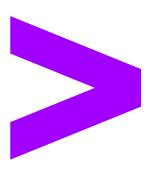

Command:

```
C:\Terraform_Repository\Demo1_s3_bucket>terraform destroy
```

Result:

```
C:\Terraform_Repository\Demo1_s3_bucket>terraform destroy
aws_s3_bucket.bucket1: Refreshing state... [id=lkm-neeha-bucket-2607]
Terraform used the selected providers to generate the following execution plan. Resource actions are indicated
with the following symbols:
    destroy
Terraform will perform the following actions:
 # aws_s3_bucket.bucket1 will be destroyed
    resource "aws_s3_bucket" "bucket1" {
                                      = "arn:aws:s3:::lkm-neeha-bucket-2607" -> null
        arn
                                     = "lkm-neeha-bucket-2607" -> null
= "lkm-neeha-bucket-2607.s3.amazonaws.com" -> null
        bucket
        bucket_domain_name = "lkm-neeha-bucket-2607.s3.amazonaws.com" -> null
bucket_regional_domain_name = "lkm-neeha-bucket-2607.s3.eu-west-1.amazonaws.com" -> null
                                     = false -> null
= "Z1BKCTXD74EZPE" -> null
        force_destroy
        hosted_zone_id
                                     = "lkm-neeha-bucket-2607" -> null
= false -> null
        id
        object_lock_enabled
                                     = "eu-west-1" -> null
= "BucketOwner" -> null
        region
        request_payer
        tags
        tags all
Plan: 0 to add, 0 to change, 1 to destroy.
Do you really want to destroy all resources?
  Terraform will destroy all your managed infrastructure, as shown above. There is no undo. Only 'yes' will be accepted to confirm.
 Enter a value: _
Plan: 0 to add, 0 to change, 1 to destroy.
